Moisture Removal Process

The process follows these general steps:

- Preheating: The dryer is heated to the desired temperature.
- Loading: Material is placed onto trays, evenly distributed.
- Drying: Hot air or gases flow over the material, causing moisture to evaporate.

- Moisture Extraction: Moisture-laden air is exhausted and replaced with dry, heated air.
- Unloading: The dried material is removed once the desired moisture level is achieved.

Factors Affecting Drying Efficiency

Several factors influence the effectiveness of drying:

- Air temperature and humidity
- Airflow rate
- Tray spacing and material thickness
- Initial moisture content
- Material thermal properties

Optimizing these parameters ensures maximum throughput with minimal energy use.

Types of Traybal Dryers

Vertical Tray Dryers

Vertical designs stack trays vertically, allowing for compact footprints and efficient use of vertical space. They typically operate with natural or forced convection and are suitable for powders, granules, or small particles.

Horizontal Tray Dryers

Horizontal models have trays arranged horizontally, often in a rotating drum or conveyor system. They are ideal for larger or bulkier materials requiring gentle handling.

Tunnel or Conveyor Tray Dryers

These dryers feature continuous operation, where trays move through a heated tunnel, enabling large-scale processing with consistent drying times.
