## Sample Solutions and Walkthroughs for Easley and Kleinberg Exercises

### Example 1: Maximum Flow Problem

Suppose you are given a directed network with capacities and asked to find the maximum flow from source  $s$  to sink  $t$ .

- Model the network as a graph with nodes and directed edges with capacity values.
- Initialize flow to zero on all edges.
- Use the Ford-Fulkerson algorithm:
  - Find an augmenting path using BFS or DFS.
  - Update capacities along the path.
  - Repeat until no augmenting paths remain.
- The sum of flows into  $t$  is the maximum flow.

### Example 2: Shortest Path Calculation

Given a weighted network, find the shortest path from node A to node B.

- Choose the appropriate algorithm (Dijkstra's for non-negative weights).
- Initialize distances, setting the start node A to zero and others to infinity.
- Use a priority queue to select the next node with the smallest tentative distance.
- Update neighboring node distances if a shorter path is found.
- Continue until reaching node B or exploring all nodes.
- Trace back the path from B to A to identify the shortest route.

### Example 3: Network Connectivity and Critical Nodes

Identify nodes whose removal disconnects the network.

- Calculate the network's connectivity using algorithms like Tarjan's for articulation points.
- Remove identified critical nodes and observe the impact on network connectivity.
- Assess network resilience by simulating failures and measuring the size of the largest connected component.

## 2. Influence and Diffusion Models

Many exercises focus on models of influence spread, such as the Independent Cascade Model and Linear Threshold Model. These simulate how behaviors, information, or innovations propagate through networks, highlighting the roles of influential nodes, thresholds, and cascade effects.

## 3. Network Formation and Strategic Behavior

Some problems delve into how agents form links strategically, considering costs and benefits. These exercises explore concepts like stable networks, network formation games, and equilibrium analysis.

## 4. Algorithmic Problems and Optimization

Efforts to identify key nodes (e.g., influential spreaders), optimize network flow, or enhance robustness often involve algorithm design and computational complexity considerations, addressed through exercises involving greedy algorithms, heuristics, and approximation methods.

## 5. Probabilistic and Statistical Analysis

The exercises incorporate probabilistic reasoning to analyze expected outcomes, variance, and likelihood of cascade events, blending statistical tools with network models.

## Typical Structure of Easley and Kleinberg Network Exercises

The exercises often follow a structured approach to facilitate learning and application:

### Problem Statement

Clear articulation of the scenario, often involving a network with specified properties or parameters. For example, a network with a given number of nodes and edges, or particular influence thresholds.

### Assumptions and Constraints

Explicit assumptions about agent behavior, influence probabilities, costs, or other relevant factors to shape the problem environment.
